How is each individual horse's speed index calculated?

For example: If a horse runs a 350-yard time of 17.59 at Los Alamitos, he would earn a speed index of 89. That horse finished in a time that was .36 seconds slower than the 100 speed index of 17.23. Therefore, the difference (.36 seconds) is divided by .034, which equals one speed index point at that distance. The result is 10.58 (.36 divided by .034), therefore the rounded number of 11 points are subtracted from 100 to give that horse a speed index of 89. Had the horse gone 17.17 seconds, which is .06 seconds faster than the 100 speed index of 17.23, then you would have added the two points, giving him a speed index of 102.
